

- ⇒ Construct a bot to print data on Notepad.
- First of all we create a sequence then we click on open application and in mean time we also opened our notepad so we can perform activities effectively or for open application we may also use input dialog box in do.
- Then in open application, we put the notepad and in do part we write the command which we want to display on notepad.
- Then we use click and put the condition i.e file and again we use another click to save the file by using save as.
- Now, we use type into in which we select the file name and lastly again. Select the save option, our file got saved.
- Then, debug the file our program executed.
